## Introduction

*The Health of the Volunteer 2007*, published by the Epidemiology and Surveillance Unit of the Peace Corps Office of Medical Services (OMS), contains information on health conditions experienced by Peace Corps and Peace Corps Response Volunteers and trainees during the 2007 calendar year.

*The Health of the Volunteer* reflects OMS' mission to monitor and evaluate trends in health conditions of Peace Corps Volunteers and trainees. It provides Peace Corps Medical Officers (PCMOs), Volunteers, and agency staff with information on global and regional health conditions and trends in order to focus prevention efforts.

This report includes 2007 highlights along with details of each reported condition and event. Appendices have enlarged figures, tables, and country-specific data.

## Data

### **Data sources**

Information used to prepare this report came from PCMOs through monthly Epidemiologic Surveillance System (ESS) reports (Appendix A). Accommodation data were collected by the OMS Pre-service Unit. Post-service claims data were provided through the OMS Post-service Unit. Information on mental health consultations was collected by the Office of Special Services (OSS).

Throughout this document the term “Volunteer” includes Peace Corps Volunteers and trainees as well as Peace Corps Response (formerly Crisis Corps) Volunteers.

### **Data analysis**

#### *Incidence Rates*

Incidence is the number of new cases of a disease or condition. Incidence rate is the proportion of new cases within the population at risk.

In *The Health of the Volunteer*, incidence rates are expressed per 100 Volunteer-trainee years (VT years).

These rates are calculated by dividing the number of new cases of disease in a year by the VT year count and then multiplying by 100.

$$\text{Rate in VT years} = \left( \frac{\text{Number of new cases of disease}}{\sum (\text{Time each Volunteer & trainee served in years})} \right) \times 100$$

#### *Volunteer-trainee Years*

Volunteer-trainee years (VT years) were first used in *The Health of the Volunteer* in 1998. VT years take into account both the number of Volunteers and the length of time each Volunteer served. Since Volunteers may serve less than a full calendar year, counting VT years is more precise than counting individual Volunteers.

#### *Female Volunteer-trainee Years*

Rates for pregnancy and gynecological infections are given per 100 female VT years. Since these two conditions affect only females, male Volunteers have been excluded from the denominator in these calculations.

#### *Trend lines*

Figures showing incidence rates over time display trend lines to emphasize tendencies in data direction. In 2007, trend lines were tested for joins, or places where the data trend shows a significant direction change. Trend lines displayed in the 2006 HOV were not tested for joins and differ from those shown in 2007 in some figures.

Trendlines were created using Joinpoint, a program freely available from the National Cancer Institute. Information on this method is available at <http://srab.cancer.gov/joinpoint>.

#### *Limitations*

There are several limitations to the information presented in this report. If Volunteers do not seek healthcare from the PCMO, the number of reported cases may be an undercount of the actual burden of disease. Not all conditions can be precisely confirmed, so some reported cases may be misclassified.

Incidence rates based on small numbers of cases (20 or less) should be interpreted with caution since a change of a few cases can produce a large change in rate. Most country-specific rates fall into this category. In the figures provided, counts are given instead of rates when the number of cases in one or more categories is less than 20.

### **2007 Changes**

#### *Changes to Peace Corps Countries*

Peace Corps served in 67 countries in 2007 (Appendix B). During this year, two posts were opened, Cambodia (February) and Ethiopia (October). Guinea was suspended from February through August. No sites were closed in 2007.

#### *Changes to the Epidemiologic Surveillance System*

Changes to the 2007 ESS include division of the Mental Health Problem category to include three sub-categories:

- Recurrence of Accommodated Condition
- Adjustment issues to Peace Corps
- Other Mental Health Problem

One new category was added to the ESS: New Accommodated Conditions.

The number of Volunteers and trainees at each post is no longer reported on the ESS.

The number of PCMO contacts is no longer reported.

#### *Changes to The Health of the Volunteer*

There were several changes in content and formatting in the 2007 edition of *The Health of the Volunteer*:

- Categories showing a significant rate change from 2006 to 2007 were displayed by region.
- Region-specific trends over time were shown for selected categories.
- Malaria rates were calculated based on the antimalarial chemoprophylaxis prescribed to the Volunteer at the time.

- Information on mental health consultations performed by the Office of Special Services was included.
- The appendix showing larger versions of each figure was removed. Figures suitable for enlargement and display are available through *Inside Peace Corps* on the Epidemiology page or by request.

### **Feedback**

Comments on the content of this report and suggestions to enhance its usefulness, especially as a training tool for Volunteers, are encouraged. Please direct feedback to Christine Korhonen in the Epidemiology and Surveillance Unit at [ckorhonen@peacecorps.gov](mailto:ckorhonen@peacecorps.gov) or 202.692.1516.

## 2007 Highlights

### Notable

#### **Dengue increase in IAP**

From 2006 to 2007 the dengue case rate in IAP increased by 80 percent, from 70 to 127 cases (3.0 to 5.1 per 100 VT years).

#### **Africa reports most PEP use**

Seventy-three percent (93 out of 127) of post-HIV exposure prophylaxis (PEP) recipients were Africa Volunteers for a rate of 3.4 prescriptions per 100 VT years.

#### **Alcohol problem increase in EMA**

After the low of 19 cases in 2006, alcohol problems in EMA increased. Thirty-seven cases of alcohol problems were reported from EMA in 2007 for a rate of 2.9 problems per 100 VT years.

#### **Regional medevacs continue to exceed U.S. Medevacs**

The trend of sending medevacs to regional centers continued in 2007. This year there were 211 (2.8 per 100 VT years) medevacs to regional centers and 150 (2.0 per 100 VT years) medevacs to the U.S. (Washington D.C., Hawaii, or home of record).

### New categories

#### **Recurrence of accommodated condition**

Among those Volunteers arriving in country with a mental health accommodation, 139 (1.9 cases per 100 VT years) were seen by a PCMO for an occurrence of their accommodated condition.

#### **Adjustment issues to Peace Corps**

Among all Volunteers, 494 (6.7 cases per 100 VT years) saw a PCMO for adjustment issues relating to Peace Corps service.

#### **Other mental health problem**

Mental health problems other than those listed above were reported for 792 Volunteers (10.7 cases per 100 VT years).

#### **Office of Special Services mental health consultations**

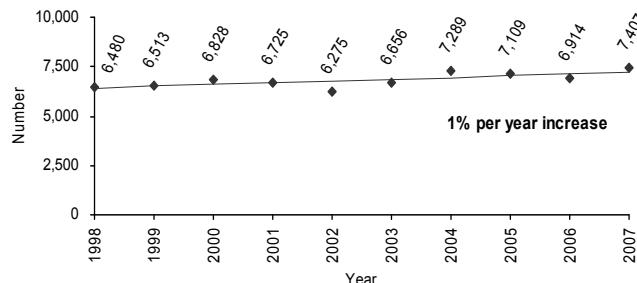

The Office of Special Services provided 149 telephone and 28 in-person mental health consultations to Volunteers.

#### **New accommodated conditions**

Twenty-six Volunteers were accommodated for new medical conditions after they arrived at post.

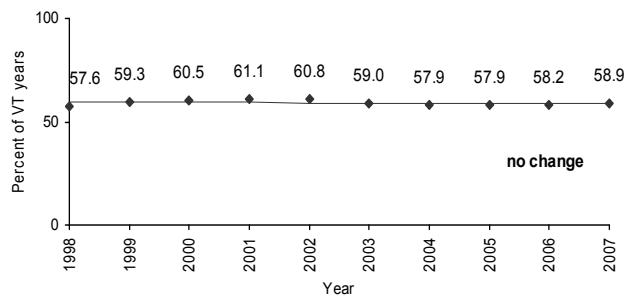

## Volunteer demographics

**Figure 1: Number of Peace Corps Volunteer-trainee years served, by year—1998–2007**

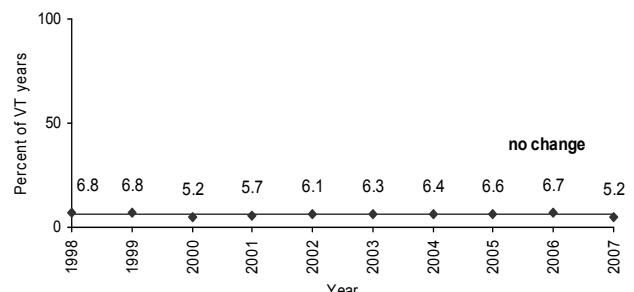

In 2007, Peace Corps Volunteers, trainees, and Peace Corps Response Volunteers served a total of 7407 Volunteer-trainee years (VT years). The overall number of VT years has increased at an average of 1 percent per year.

**Figure 2: Percent of Peace Corps Volunteer-trainee years served by female Volunteers, by year—1998–2007**

Female Volunteers served 4364 VT years, over half of the VT years served (58.9 percent). The proportion of VT years served by females has remained relatively constant since 1998.

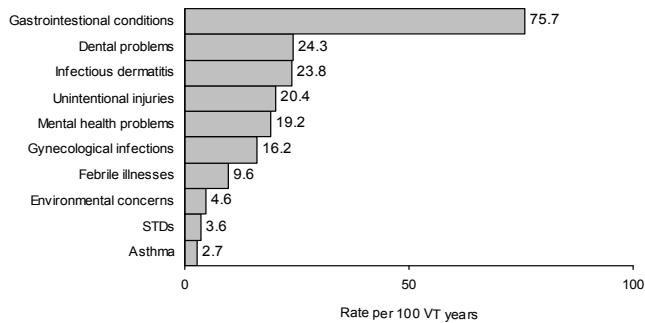

**Figure 3: Percent of Peace Corps Volunteer-trainee years served by 50+ Volunteers, by year—1998–2007**

Volunteers aged fifty years and over served 387 VT years in 2007, 5.2 percent of the total VT years served. The proportion of VT years served by Volunteers fifty years of age and over has remained relatively constant since 1998.

## Most common conditions

**Figure 4: Most commonly reported conditions—Peace Corps Volunteers, 2007**

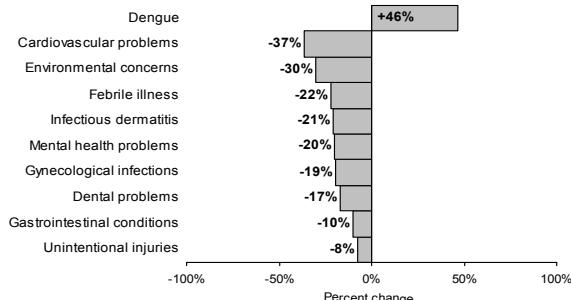

The most commonly reported conditions in 2007 were similar to those seen in past years. Gastrointestinal conditions led the way with a rate of 75.6 cases per 100 VT years while dental problems were the second most reported condition with a rate of 24.3 visits per 100 VT years.

Many categories had substantially fewer cases of disease in 2007 than in 2006. Because of this, differences between the two years were further examined.

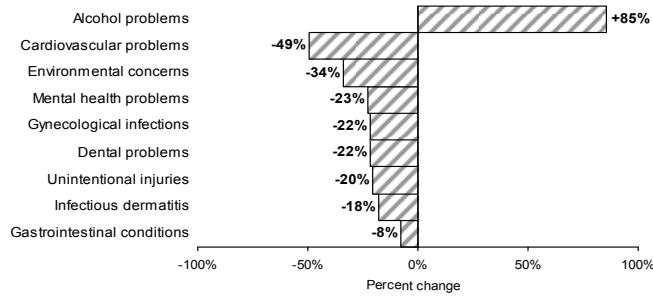

## Conditions with significant rate differences from 2006 to 2007

**Figure 5: Conditions with significant rate differences, —Peace Corps Volunteers, 2006 to 2007**

Worldwide, ten conditions had statistically significant differences in rate from 2006 to 2007. Nine of these conditions saw a rate decrease. Dengue was the only condition with a significant rate increase during this time, increasing 48 percent from 1.4 to 2.1 cases per 100 VT years (97 to 152 cases).

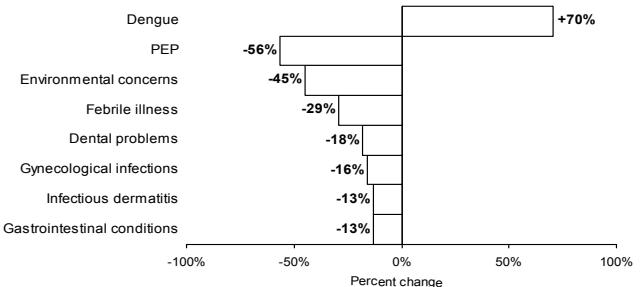

**Figure 6: Conditions with significant rate differences, —Peace Corps Volunteers (EMA Region only), 2006 to 2007**

In EMA, the rate of alcohol problems increased 86 percent between 2006 and 2007, from 0.9 to 1.7 problems per 100 VT years (19 to 37 cases). This increase is explored more fully in the section detailing alcohol problems.

Rate decreases seen in EMA but not the other regions included cardiovascular problems which saw a rate decrease of 49 percent, from 2.3 to 1.1 problems per 100 VT years (47 to 25 cases), and unintentional injuries which saw a decrease of 20 percent, from 26.5 to 21.1 injuries per 100 VT years (552 to 452 cases).

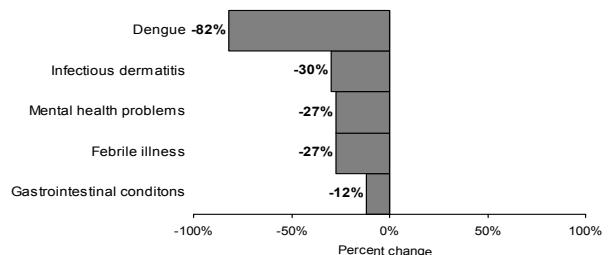

**Figure 7: Conditions with significant rate differences—Peace Corps Volunteers (IAP Region only), 2006 to 2007**

The 2007 increase in dengue infections took place in IAP where the regional rate went up 70 percent, from 3.0 to 5.1 cases per 100 VT years (70 to 127 cases).

The decrease in PEP use by 68 percent in IAP, from 1.2 to 0.5 prescriptions per 100 VT years (28 to 13 prescriptions), was not seen in the other regions.

**Figure 8: Conditions with significant rate differences—Peace Corps Volunteers (Africa Region only), 2006 to 2007**

Africa saw no significant rate increases from 2006 to 2007. The most striking rate decrease in Africa region was an 82 percent decrease in the rate of dengue cases, from 0.6 to 0.1 cases per 100 VT years (15 to 3 cases).

Many conditions with significant rate differences appeared in multiple regions. Infectious dermatitis and gastrointestinal conditions decreased in all regions. Environmental concerns, dental problems and other gynecological infections decreased in both EMA and IAP. Febrile illness decreased in both IAP and Africa, while mental health problems decreased in both EMA and Africa.

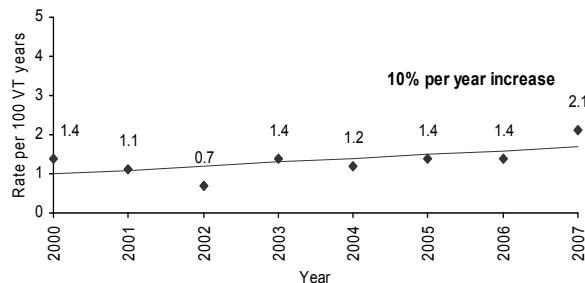

## Conditions

### Infectious conditions

#### Dengue

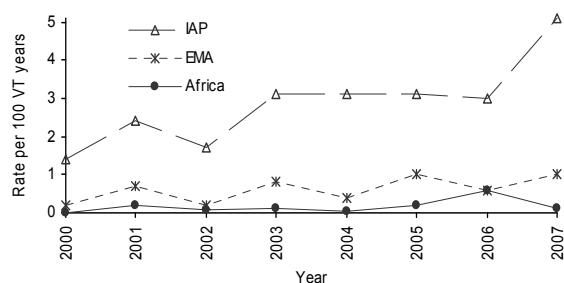

Dengue is a viral disease transmitted to humans by infected mosquitoes. Symptoms include high fever, severe headache, and joint and muscle pain. Dengue Hemorrhagic Fever (DHF) is a severe form of dengue which causes internal bleeding.

**Figure 9: Incidence of dengue infections, by year—Peace Corps Volunteers, 2000–2007**

There were 152 cases of dengue among Volunteers in 2007 resulting in an incidence rate of 2.1 cases per 100 VT years. This rate is 47 percent greater than the dengue rate in 2006. The 2006 rate was 1.4 per 100 VT years). Since 2000, on average there has been a 10 percent per year increase in dengue cases among Volunteers.

**Figure 10: Incidence of dengue infections, by region and year—Peace Corps Volunteers, 2000–2007**

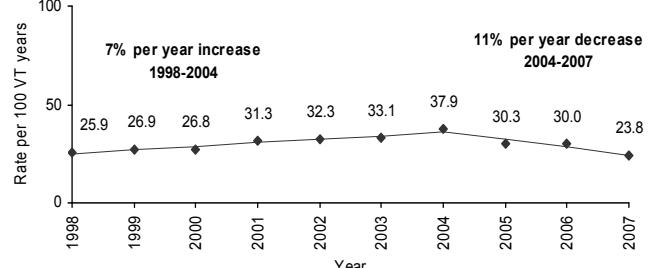

IAP reported 127 (84 percent) of the 152 dengue cases in 2007. The IAP dengue rate increased 70 percent from 2006 to 2007 (3.0 to 5.1 cases per 100 VT years;

70 to 127 cases). The Dominican Republic and Honduras reported the greatest number of dengue cases in 2007 (47 and 30 cases respectively).

#### Dermatitis, infectious

**Figure 11: Incidence of infectious dermatitis, by year—Peace Corps Volunteers, 1998–2007**

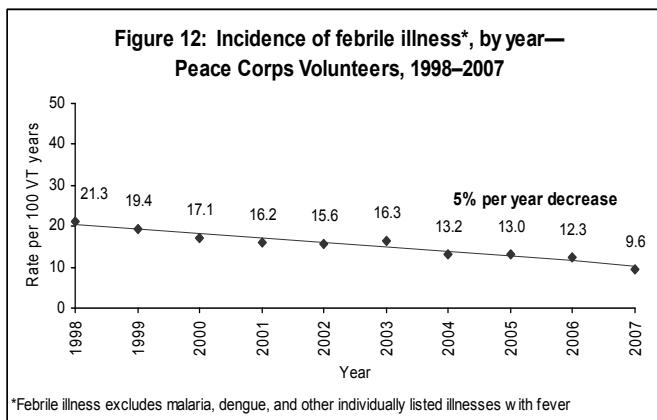

The third most commonly reported condition among Volunteers in 2007 was infectious dermatitis with a rate of 23.9 cases per 100 VT years (1,764 cases). Infectious dermatitis rates increased by 7 percent per year from 1998 to 2004 then decreased by 11 percent per year from 2004 to 2007.

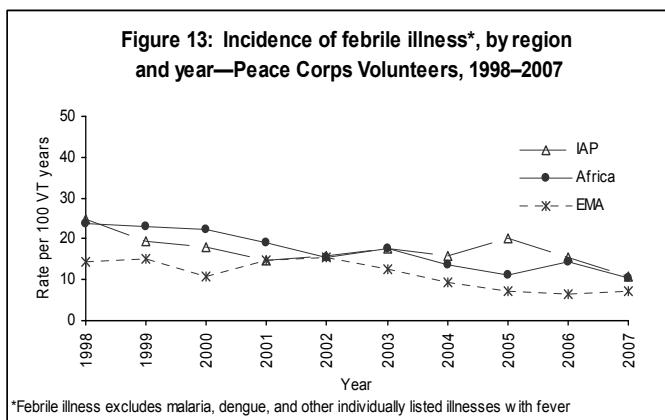

Infectious dermatitis includes any infection of the skin by bacterial, fungal or parasitic organisms. These conditions may or may not be laboratory confirmed. Non-infectious skin conditions such as acne, eczema, or non-specific rashes were not included.

#### Febrile illness, other

This category includes any illness accompanied by a documented temperature of at least 38 degrees Celsius (100.4 degrees Fahrenheit). These illnesses either have a known etiology and are not reportable in the ESS categories (e.g. infectious mononucleosis, strep throat) or are of unknown etiology and do not fit into any of the ESS presumptive reportable categories such as presumptive malaria or presumed hepatitis (e.g. influenza or non-confirmed dengue).

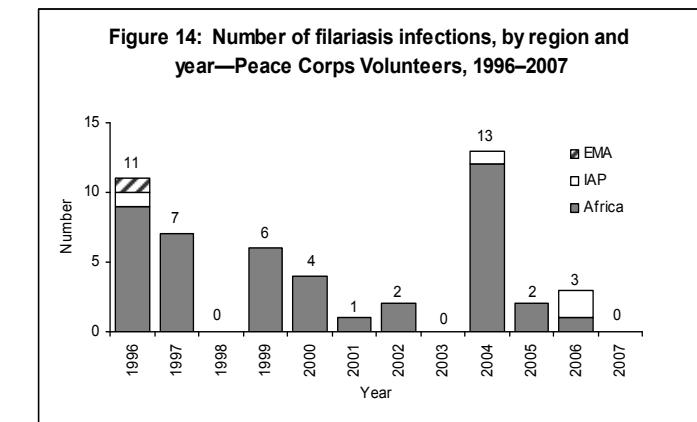

Other febrile illness had a rate of 9.6 cases per 100 VT years (713 cases) in 2007. Reports of febrile illness decreased 5 percent per year since 1998.

Reports of other febrile illness decreased significantly in IAP and Africa from 1996 to 1997.

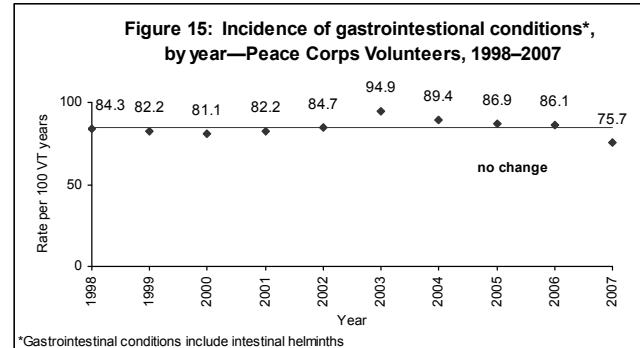

### Filariasis

Filariasis is a group of parasitic diseases caused by microscopic, thread-like worms. Lymphatic filariasis is contracted through the bite of an infected mosquito and can cause swelling (lymphedema), as well as thickening, hardening, and disfiguration of the skin (elephantiasis) usually affecting the limbs, breasts, and genitals. Onchocerciasis (River Blindness) is contracted through the bite of an infected black fly and can cause inflammation, while chronic infection can produce blindness. *Loa loa* or African eye worm is contracted through the bite of an infected horse fly and can cause lymphedema, itching, inflammation, and migration of worms through the eyeballs.

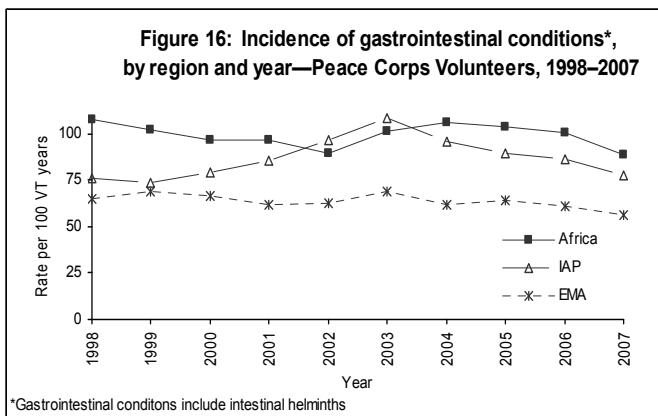

There were no reported cases of filariasis among Volunteers in 2007. The category filariasis includes lymphatic filariasis, onchocerciasis, and *Loa loa*.

### Gastrointestinal conditions

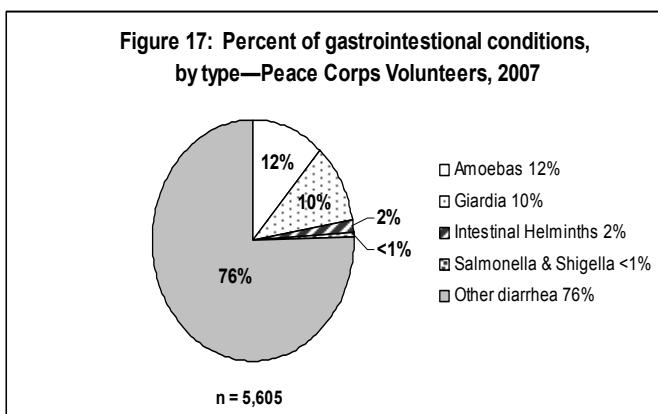

Gastrointestinal conditions continue to lead reportable condition categories with a rate of 75.7 cases per 100 VT years (5605 cases). The rate of gastrointestinal conditions has remained fairly consistent since 1998.

In 2007, intestinal helminths were included in the gastrointestinal condition category. Past year rates shown in Figure 15 have been recalculated to accommodate this change, therefore these rates differ from those shown in prior HOVs.

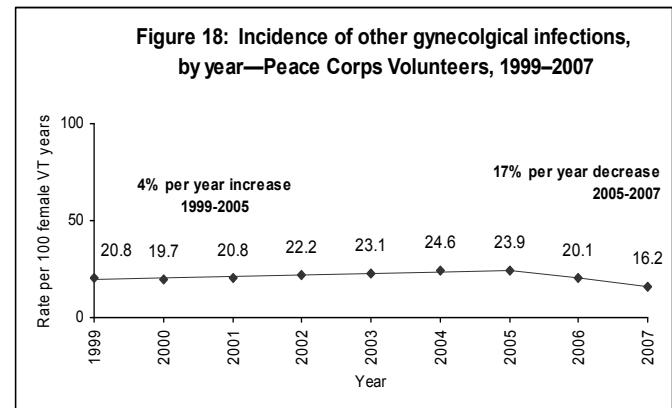

There was a significant decrease in gastrointestinal conditions in all regions from 2006 to 2007.

Among the 5605 gastrointestinal conditions reported in 2007, 12 percent were amebiasis, 10.5 percent giardiasis, 2 percent intestinal helminths, 0.2 percent salmonellosis and 0.2 percent shigellosis. The remaining 76 percent of cases were classified as “other diarrhea.”

Gastrointestinal conditions include laboratory confirmed and non-laboratory confirmed conditions with four or more liquid or watery stools per day.

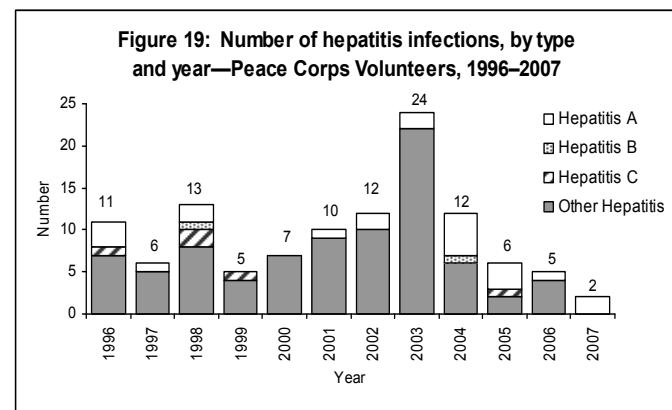

### Gynecological infections, other

Other gynecological infections include bacterial vaginosis, vaginal yeast infection, and pelvic inflammatory disease.

There were 707 other gynecological infections reported in 2007 for a rate of 16.2 cases per 100 female VT years. This rate increased an average of 4 percent per year from 1999 to 2005 and decreased 17 percent per year from 2005 to 2007.

### Hepatitis

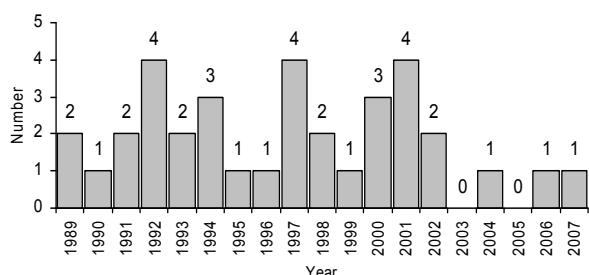

There were two cases of hepatitis A reported among Volunteers in 2007. The number of hepatitis cases has been decreasing each year from a high of 24 cases in 2003.

The “other hepatitis” category includes hepatitis E and presumed hepatitis as well as infectious and non-infectious causes of elevated amino-transferase levels.

## HIV

**Figure 20: Number of HIV infections, by year—Peace Corps Volunteers, 1989–2007**

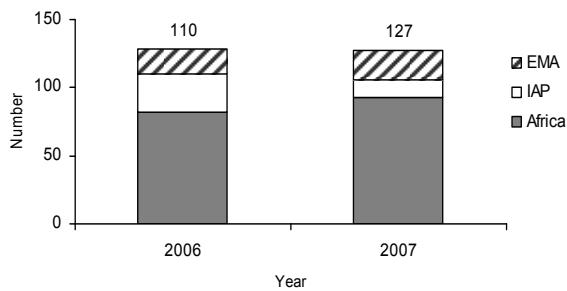

In 2007, one Volunteer tested positive for HIV.

Since 1989, thirty-five Volunteers have tested positive for HIV during service. Peace Corps initiated HIV screening in 1987. Volunteers have been screened both prior to and at the end of service since 1989.

## Post exposure prophylaxis

**Figure 21: Number of Post Exposure Prophylaxis (PEP) prescriptions, by region and year—Peace Corps Volunteers, 2006–2007**

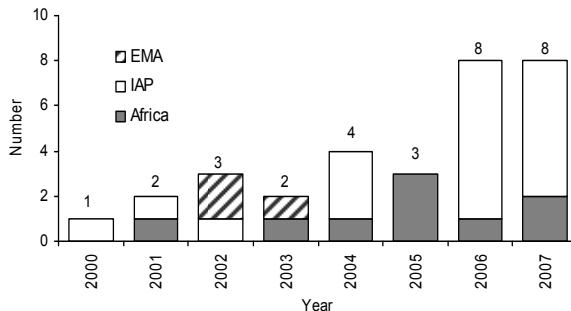

HIV post exposure prophylaxis (PEP) was prescribed to 127 Volunteers for a rate of 1.9 prescriptions per 100 VT years in 2007. The majority of PEP (73 percent; 93 cases) was prescribed in Africa. The Africa PEP rate remained constant from 2006 to 2007 (3.3 to 3.4 prescriptions per 100 VT years; 82 to 93 cases). IAP saw a 58 percent decrease in the rate of PEP prescriptions from 2006 to 2007 (1.2 to 0.5 prescriptions per 100 VT years; 28 to 13 cases). The PEP prescription rate in EMA remained constant over this time (0.9 to 1.0 prescriptions per 100 VT years; 18 to 21 cases).

PEP has been available since 1997 to Volunteers potentially exposed to HIV. Data on PEP use was first collected in 2006.

## Leishmaniasis

Leishmaniasis is a parasitic disease spread to humans through the bite of infected sand flies. The two most common forms are cutaneous, which produces skin sores, and visceral, which affects internal organs such as the spleen, liver, and bone marrow.

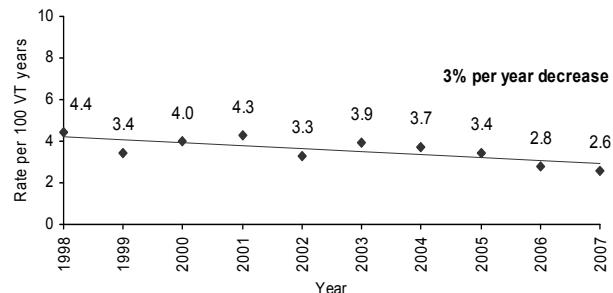

**Figure 22: Number of leishmaniasis infections, by year—Peace Corps Volunteers, 2000–2007**

There were eight cases of leishmaniasis reported among Volunteers in 2007. Six of these cases were from the IAP region with four cases from Panama. In 2006, six of the seven cases of leishmaniasis reported from IAP were from Panama.

## Malaria

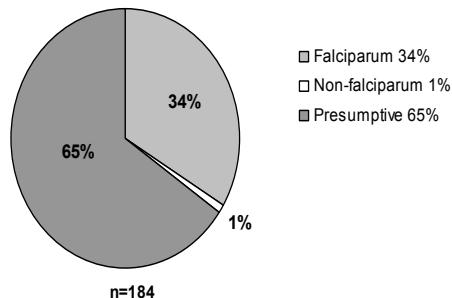

**Figure 23: Incidence of malaria, by year—Peace Corps Volunteers, 1998–2007**

The overall rate of malaria among all Volunteers was 2.6 cases per 100 VT years in 2007 (195 cases). This rate has decreased an average of 3 percent per year since 1998.

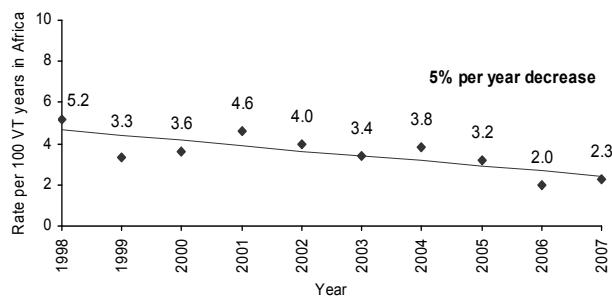

Regionally, Africa saw the most malaria (94 percent; 184 cases). Ten cases of malaria were reported from IAP, and one case of presumptive malaria was reported from Armenia in EMA. This Volunteer had recently returned from travel to a malaria endemic area.

**Figure 24: Percent of malaria, by type—Peace Corps Volunteers (Africa region only), 2007**

Of the 184 malaria infections among Africa Volunteers, 34 percent (62 cases) were confirmed *Plasmodium falciparum*, 1 percent (2 cases) were confirmed other *Plasmodium* species, and 65 percent (120 cases) were presumptive malaria.

**Figure 25: Incidence of falciparum malaria, by year—Peace Corps Volunteers (Africa region only), 1998–2007**

The rate of *falciparum* malaria in Africa was 2.3 per 100 VT years in 2007 (184 cases). This rate has decreased an average of 5 percent per year since 1998.

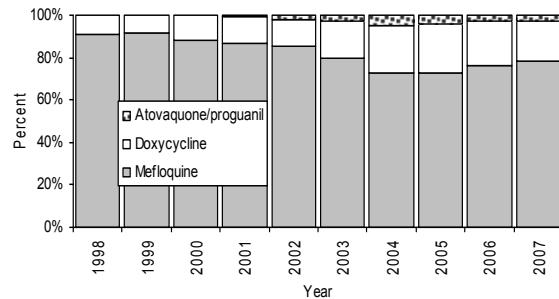

### **Antimalarial chemoprophylaxis**

The ESS tracks the number of Volunteers taking long-term antimalarial chemoprophylaxis each month. Short-term use (e.g. for travel) is not recorded.

The average yearly estimate of Volunteers on antimalarial chemoprophylaxis was 58 percent in 2007: 98 percent of Africa Volunteers, 57 percent of IAP Volunteers, and 9 percent of EMA Volunteers.

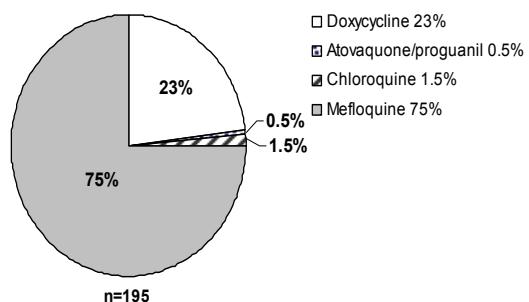

Since the average yearly estimate includes both the number of Volunteers and the time they were taking chemoprophylaxis, this average is interpreted using both measures. For example, if 50 percent of Volunteers took chemoprophylaxis for the whole year or if 100 percent of Volunteers took chemoprophylaxis for half of the year, both instances would produce an average yearly estimate of 50 percent. The average yearly estimate is most accurate if the number of Volunteers in a country remains stable throughout the year.

**Figure 26: Proportion of prescribed antimalarial drugs, by type and year—Peace Corps Volunteers (Africa region only), 1998–2007**

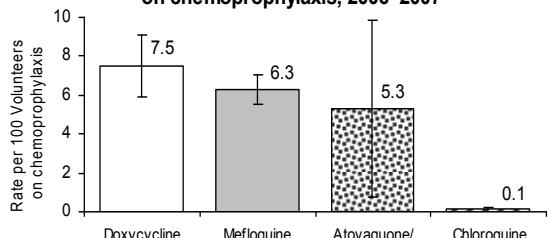

For Volunteers in the Africa region who took antimalarial chemoprophylaxis, mefloquine was used by 78 percent, doxycycline was used by 19 percent, atovaquone/proguanil was used by 3 percent, and 0.04 percent used minocycline (a variant of doxycycline used to treat acne with the same antimalarial properties).

**Figure 27: Percent of malaria, by chemoprophylaxis prescribed—Peace Corps Volunteers with malaria, 2007**

Starting in 2006, the antimalarial regimen Volunteers were taking when they were diagnosed with malaria was reported. In 2007, among the 195 Volunteers who were diagnosed with malarial worldwide, 75 percent were taking mefloquine, 23 percent were taking doxycycline, 1.5 percent were taking chloroquine, and 0.5 percent were taking atovaquone/proguanil.

**Figure 28: Rate of malaria, by chemoprophylaxis prescribed—Peace Corps Volunteers on chemoprophylaxis, 2006–2007**

Combining data from 2006 and 2007, the incidence of malaria among Volunteers taking each of the chemoprophylaxis regimens was calculated. Volunteers taking doxycycline, mefloquine, and atovaquone/proguanil had similar rates of malaria with 7.5, 6.3, and 5.3 per 100 VT years respectively. The differences between these three rates were not statistically significant as shown by their overlapping 95 percent confidence intervals. The large confidence interval for atovaquone/proguanil highlights the instability of this rate as a result of the smaller numbers of Volunteers on this chemoprophylaxis. Volunteers on chloroquine had the lowest rate of malaria, 0.1 per 100 VT years. This rate was

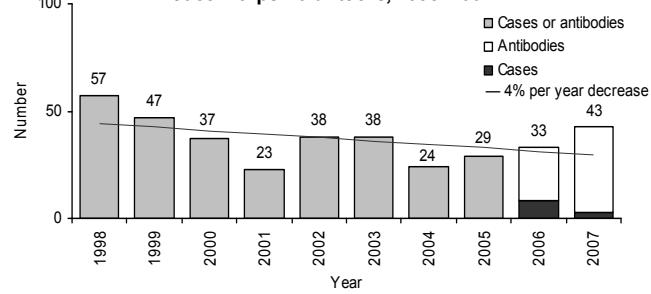

significantly lower than the rates of malaria among the other three groups.

### Schistosomiasis cases and antibodies

Schistosomiasis is a parasitic disease caused by flatworms that penetrate the skin of people who swim or wade in contaminated water. Many schistosomiasis infections are asymptomatic. Acute and chronic infections can produce progressive damage to the bladder, ureters, and kidneys (urinary schistosomiasis) as well as progressive enlargement of the liver and spleen with intestinal damage and hypertension of the abdominal blood vessels (intestinal schistosomiasis).

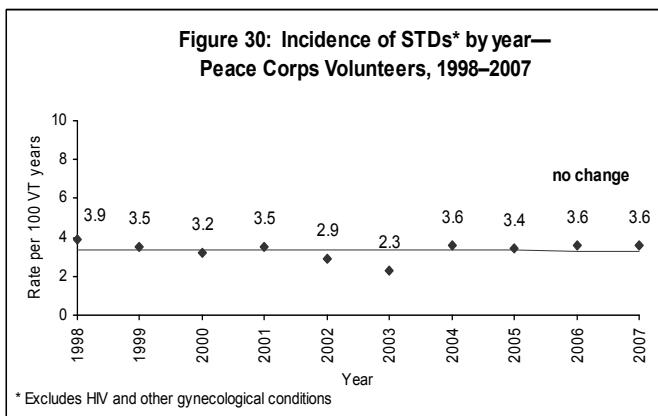

In 1998, the Peace Corps instituted universal schistosomiasis antibody screening for Volunteers completing service in endemic areas (described in Technical Guideline 850).

**Figure 29: Number of schistosomiasis cases and positive antibodies, by year—Peace Corps Volunteers, 1998–2007**

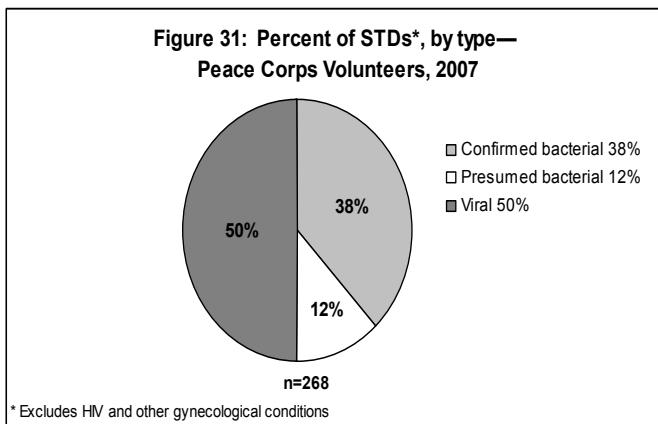

There were three cases of schistosomiasis and 40 positive antibody reports in 2007, all from Africa. In 2006 there were eight schistosomiasis cases and 25 positive antibody reports. Prior to 2006, schistosomiasis cases and positive antibodies were reported in a combined category.

### **Sexually transmitted diseases, non-HIV**

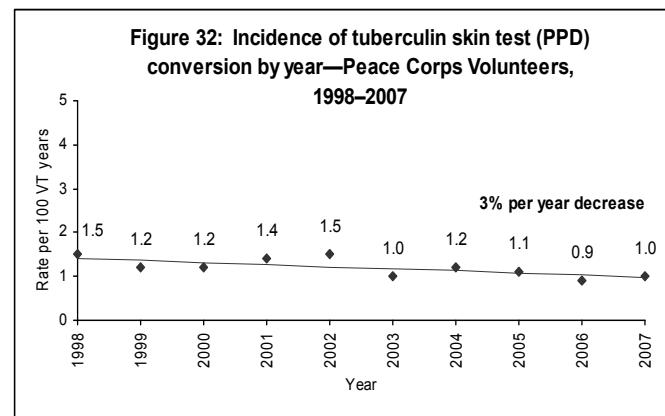

The overall rate of non-HIV sexually transmitted diseases (STDs) reported among Volunteers was 3.6 cases per 100 VT years. This rate does not include HIV or the other gynecological conditions reported on the ESS. Since 1998, this rate has remained relatively constant.

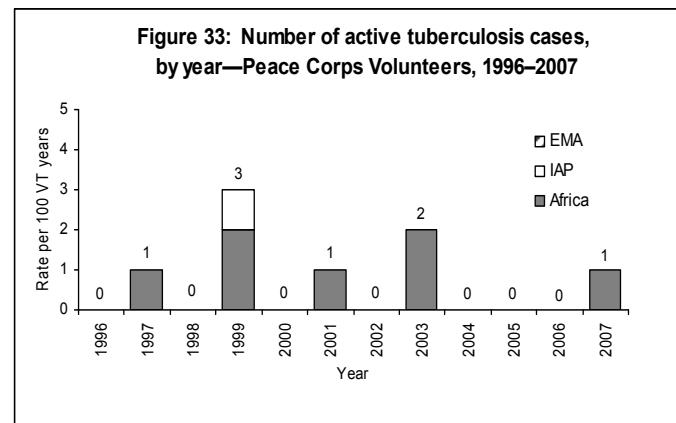

Among the 268 STDs diagnosed in 2007, 50 percent were viral (134 cases) and 50 percent confirmed (102 cases) or presumed (32 cases) bacterial. Viral STDs include genital herpes, lymphogranuloma venereum, and human papillomavirus. Bacterial STDs include syphilis, gonorrhea, chlamydia, trichomonas, and chancroid.

### **Tuberculosis**

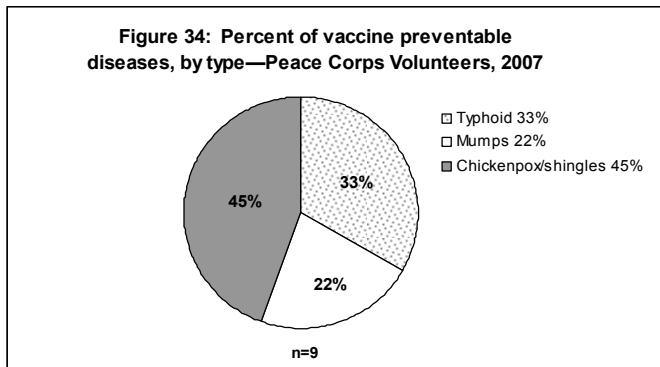

In 2007, 77 Volunteers converted to a positive purified protein derivative (PPD) test, resulting in a rate of 1.0 conversions per 100 VT years. This rate has decreased an average of 3 percent per year since 1998.

Volunteers are tested for tuberculosis with the PPD tuberculin skin test during the application process, at close of service, and after any significant exposure.

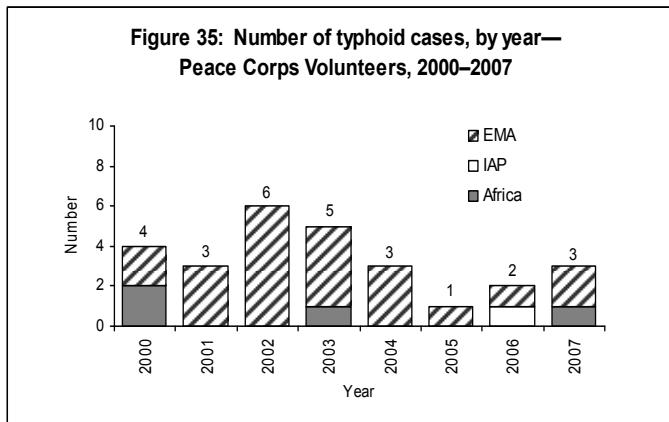

There was one case of active tuberculosis among Volunteers in 2007, the first reported since 2003. Six of the seven tuberculosis cases reported since 1998 were from the Africa region.

### Vaccine-preventable diseases

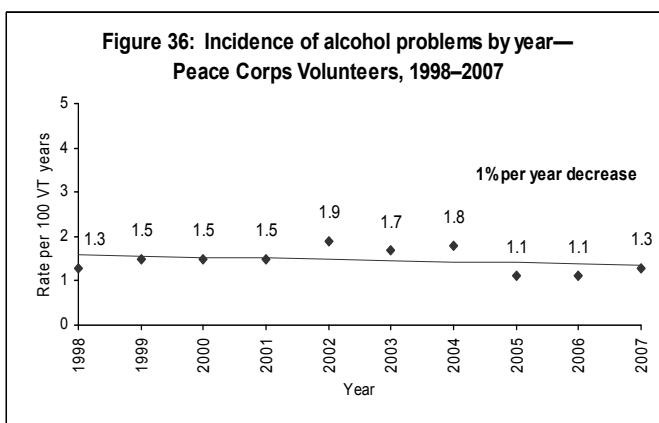

Excluding the two aforementioned cases of hepatitis, there were nine cases of vaccine-preventable diseases reported in 2007: 4 cases of chickenpox/shingles, 3 cases of typhoid, and 2 cases of mumps.

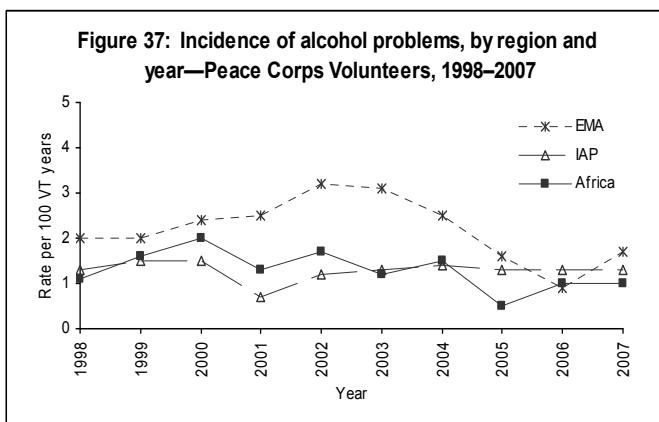

Two of the three typhoid cases in 2007 were reported from the Philippines. Since 2000, 22 of the 27 typhoid cases have been reported from the Philippines.

## Non-infectious conditions

### Alcohol-related problems

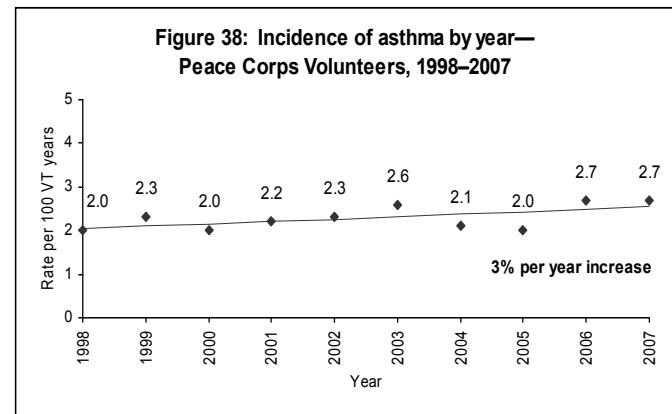

The rate of alcohol problems in 2007 was 1.3 problems per 100 VT years. Even though this rate increased slightly from 2006 to 2007, the overall trend has been a 1 percent decrease per year since 1998.

Although EMA saw an 89 percent increase in alcohol problems from 2006 to 2007 (from 0.9 to 1.7 cases per 100 VT years), EMA's 2007 alcohol problem rate is similar to the rate seen in EMA in 2005 and comparable to the 2007 IAP rate.

Alcohol problems include any incident in which behavior was altered or impaired due to alcohol intoxication. These include incidents observed by staff, Volunteers, or any reliable source.

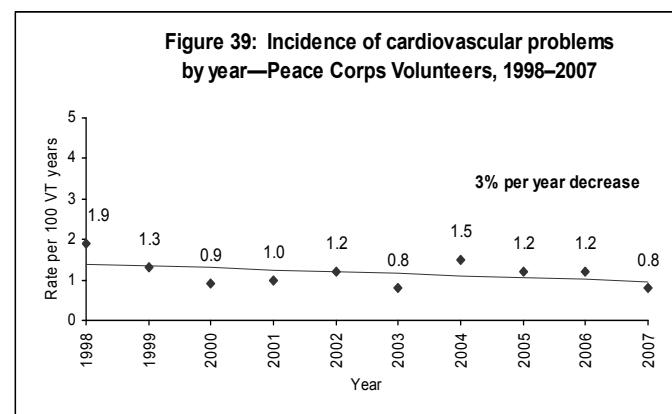

### Asthma

The rate of reported asthma (new asthma and asthma exacerbations) was 2.7 cases per 100 VT years. This rate has increased an average of 3 percent per year since 1998.

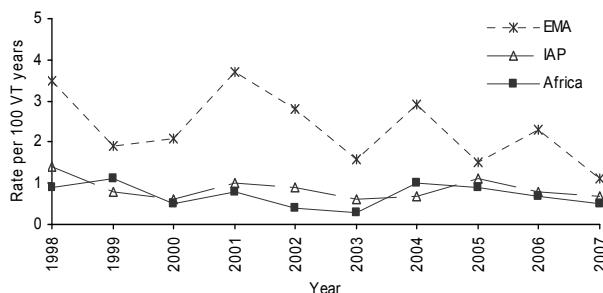

### Cardiovascular problems

Cardiovascular problems include conditions related to the heart and blood vessels evaluated by the PCMO or another healthcare professional.

The rate of cardiovascular problems among Volunteers was 0.8 problems per 100 VT years in 2007. This rate has decreased an average of 3 percent per year since 1998.

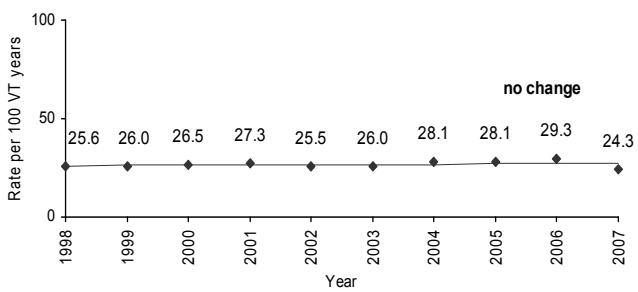

**Figure 40: Incidence of cardiovascular problems, by region and year—Peace Corps Volunteers, 1998–2007**

There was a 52 percent decrease in the rate of cardiovascular problems in EMA from 2006 to 2007, bringing the rate closer to those seen in IAP and Africa.

### Dental problems

**Figure 41: Incidence of dental problems by year—Peace Corps Volunteers, 1998–2007**

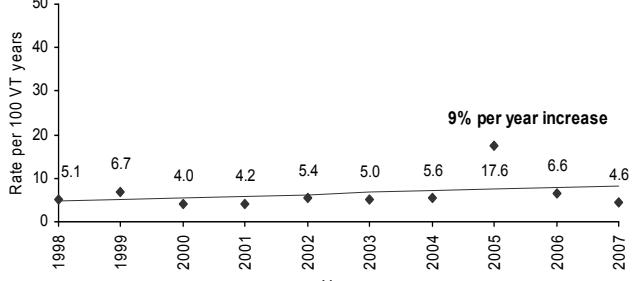

Dental problems is the second most reported condition among Volunteers with an overall rate of 24.3 problems per 100 VT years in 2007. This rate has been consistent since 1998.

Dental issues include all dental and periodontal conditions evaluated by a dentist or other healthcare professional. Follow-up visits for a single problem or routine cleanings are not included.

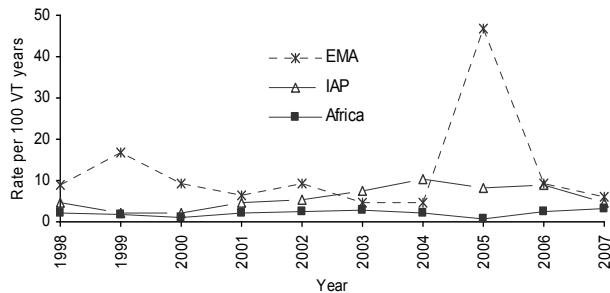

### Environmental concerns

**Figure 42: Incidence of environmental concerns by year—Peace Corps Volunteers, 1998–2007**

Environmental concerns had a rate of 4.6 concerns per 100 VT years in 2007. Due to the concerns over avian flu in 2005, the rate of environmental concerns shows an average increase of 9 percent per year since 1998.

**Figure 43: Incidence of environmental concerns, by region and year—Peace Corps Volunteers, 1998–2007**

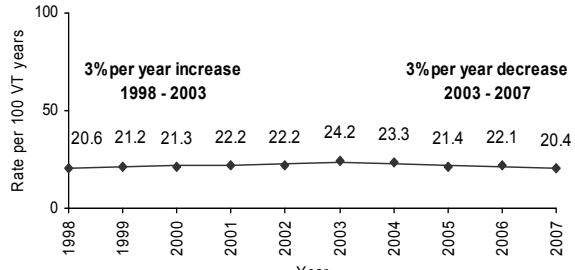

Environmental concerns significantly decreased in IAP from 2006 to 2007.

Environmental concerns are one-to-one discussions (in person or by telephone) regarding exposures to environmental threats. Topics may include air pollution, pesticides, food sanitation, natural disasters, and emerging diseases, among others.

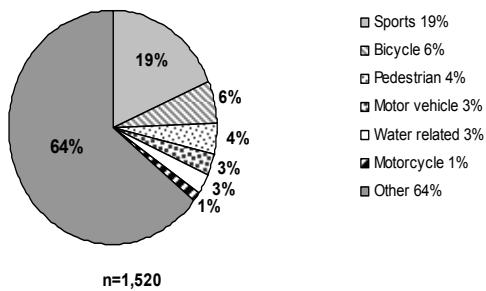

### Injuries, unintentional

**Figure 44: Incidence of unintentional injuries by year—Peace Corps Volunteers, 1998–2007**

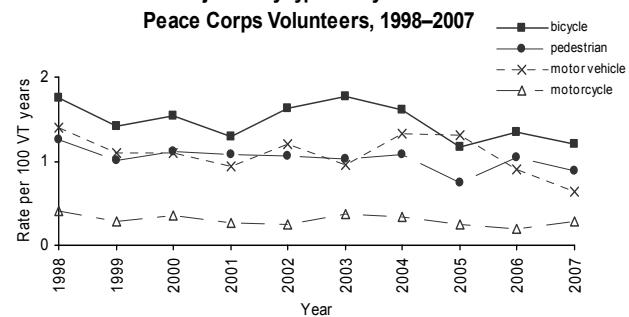

The overall unintentional injury rate was 20.4 injuries per 100 VT years. This rate increased 3 percent per year from 1998 to 2003 and then decreased 3 percent per year from 2003 to 2007.

**Figure 45: Distribution of unintentional injuries by activity—Peace Corps Volunteers, 2007**

Among the 1,520 unintentional injuries reported in 2007, 64 percent were classified in the “other” category, which includes cuts, burns, falls, and animal bites. Sports-related injuries accounted for 19 percent of the injuries, bicycle accidents 6 percent, and pedestrian accidents 4 percent. The remainder consisted of motor vehicle accidents (3 percent), water-related accidents (3 percent) and motorcycle accidents (1 percent).

**Figure 46: Incidence of vehicle-related unintentional injuries by type and year—Peace Corps Volunteers, 1998–2007**

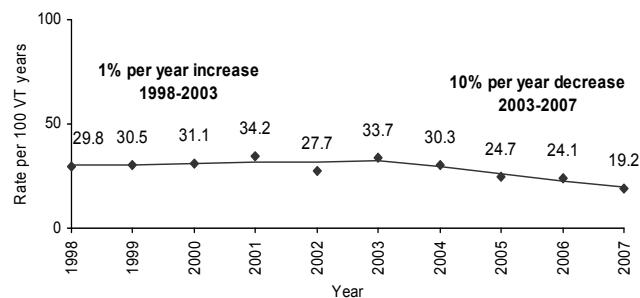

In comparing traffic related injuries (bicycle, motor vehicle, motorcycle, and pedestrian), the rate of motorcycle injuries is low compared to other traffic related injuries.

Unintentional injuries are reported if they require medical evaluation or treatment by the PCMO or other healthcare professional.

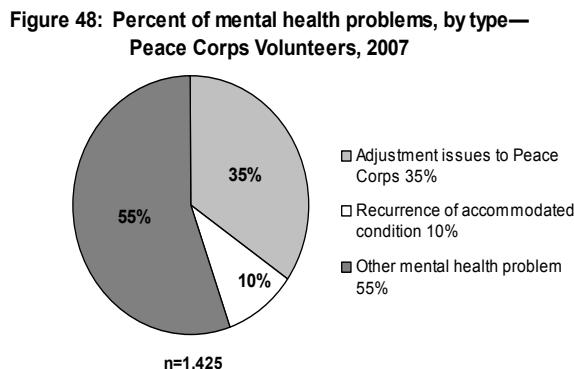

### Mental health problems

A mental health problem is a one-to-one discussion (in person or by telephone) regarding a mental health issue, such as depression, problems with interpersonal relationships, reactions to stress, or loneliness.

**Figure 47: Incidence of mental health problems by year—Peace Corps Volunteers, 1998–2007**

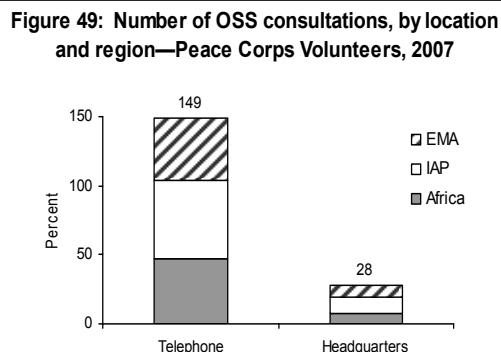

Mental health problems had rate of 19.2 problems per 100 VT years in 2007. This rate increased an average of 1 percent per year from 1998 to 2003 and then decreased 10 percent per year from 2003 to 2007.

In 2007, the mental health problem category was divided into three sub-categories: adjustment issues relating to Peace Corps service, recurrence of a previously accommodated condition, and other mental health problem. Among the 1426 mental health problems reported, 35 percent (494 cases) were adjustment issue-related conditions, 9 percent (139 cases) were recurrences of accommodated conditions, and the remaining 56 percent (792 cases) were other mental health problems.

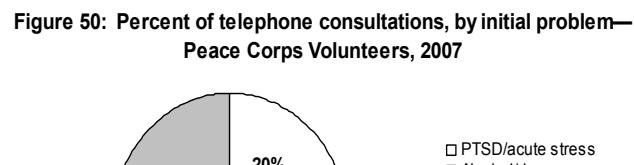

#### **Office of Special Services Mental health consultations**

The Office of Special Services (OSS) maintains records of mental health consultations provided to Volunteers and trainees. Consultations take place either over the telephone or in person at the Peace Corps Headquarters (HQ). This is the first time information on OSS mental health consultations has been included in *The Health of the Volunteer*.

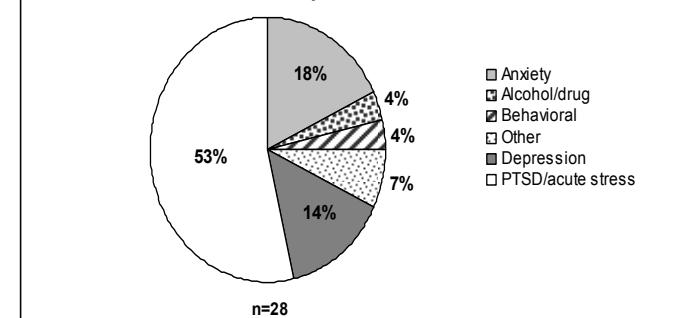

In 2007, there were 149 telephone consultations conducted by OSS resulting in a rate of 2.0 consultations per 100 VT years. There were 28 in-person consultations at Peace Corps Headquarters by OSS for a rate of 0.4 consultations per 100 VT years. Both types of consultations were evenly distributed between the EMA (45 phone, 9 HQ), IAP (57 phone, 11 HQ), and Africa (47 phone, 8 HQ) regions.

Symptoms leading to a consultation may include depression, anxiety, post-traumatic stress disorder (PTSD) or other acute stress, alcohol or drug problems, behavioral problems, or other mental health conditions.

In 2007 most of the telephone consultations were for depression (51, 34%) and anxiety (51, 34%). PTSD and acute stress were responsible for 20% (30) of the phone consultations.

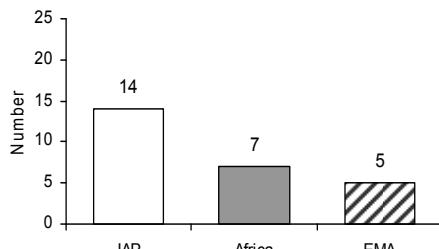

**Figure 51: Percent of headquarters consultations, by initial problem—Peace Corps Volunteers, 2007**

In 2007 over one-half of the headquarters consultations were for PTSD and acute stress (15, 53%), while anxiety (5, 18%) and depression (4, 15%) were seen less frequently.

### New accommodated conditions

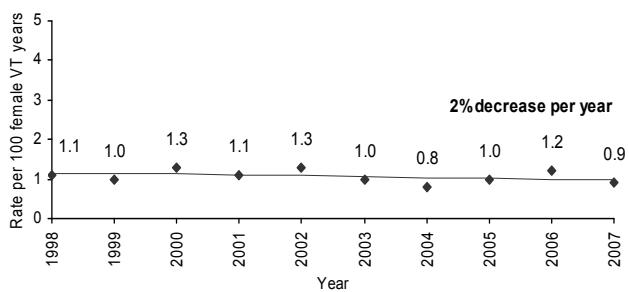

**Figure 52: Number of new accommodations, by region—Peace Corps Volunteers, 2007**

In 2007, new accommodated conditions were collected for the first time. New accommodated conditions are accommodations made at post by the PCMO. There were 26 new accommodated conditions reported: 14 from IAP, 7 from Africa, and 5 from EMA.

### Pregnancy

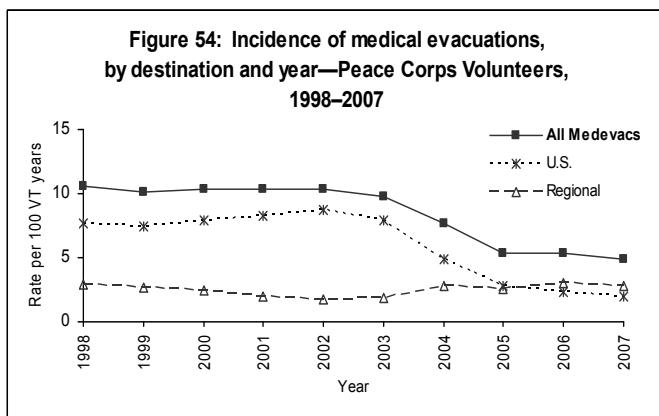

**Figure 53: Incidence of pregnancy, by year—Female Peace Corps Volunteers, 1998–2007**

In 2007, there were 39 pregnancies among female Volunteers for a rate of 0.9 pregnancies per 100 female VT years. This rate has decreased an average of 2 percent per year since 1998.

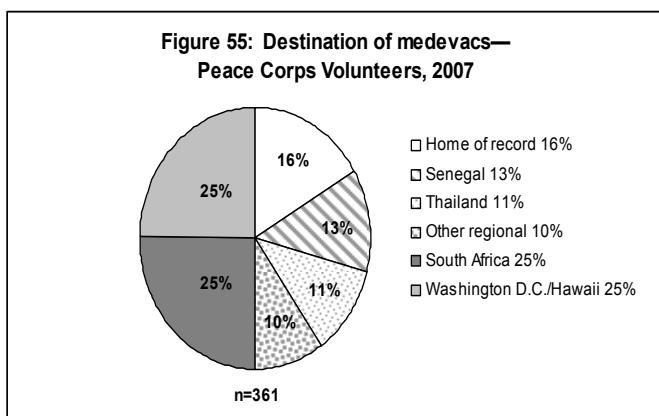

## Severe outcomes

### Medevacs

The overall medical evacuation (medevac) rate in 2007 was 4.9 evacuations per 100 VT years. Medevacs to regional centers had a rate of 2.8 evacuations per 100 VT years, while medevacs to the U.S. had a rate of 2.0 evacuations per 100 VT years.

As in 2006, the rate of medevacs to regional centers remains higher than the rate of medevacs to the U.S.

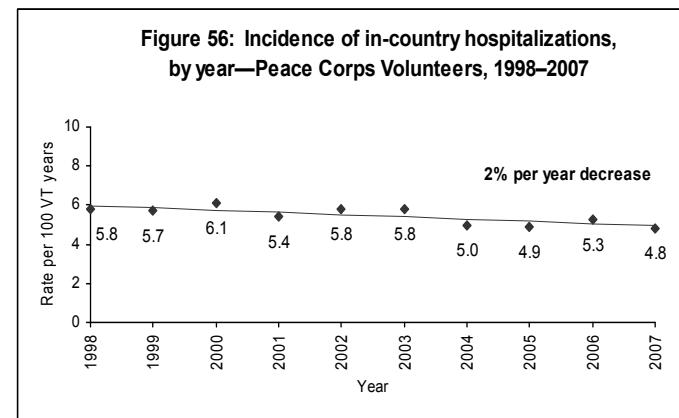

Out of 361 medevacs, 42 percent were medevacs to the U.S. (Washington D.C., home of record, or Hawaii). Regional medevacs made up 58 percent of all medevacs with most going to Senegal, Thailand, or South Africa.

Medevacs include all medical evacuations to a third country when a Volunteer's illness or injury requires evaluation or treatment not available in the Volunteer's country of service. Volunteers may be medevaced more than once or the same Volunteer

may be medevaced to a regional center and then to the U.S. In these instances, each of the medevacs has been counted here.

### In-country hospitalizations

In 2007, the rate of in-country hospitalizations for Volunteers was 4.8 hospitalizations per 100 VT years. This rate has decreased an average of 2 percent per year since 1998.

### In-service deaths

There were four deaths to serving Volunteers in 2007. Unintentional injuries resulted in one death in Suriname and one in Vanuatu. There was one presumed cardiovascular-related death in China and one homicide in the Philippines.

## Pre- and post-service

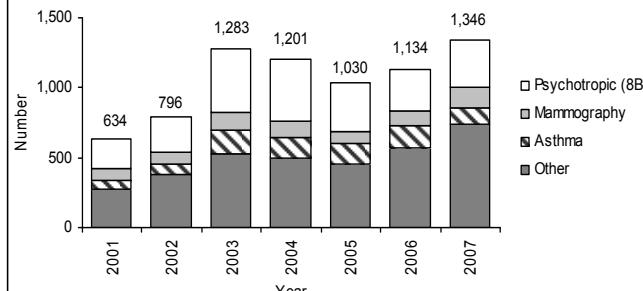

### Pre-service accommodations

The Office of Medical Services assesses all Peace Corps applicants individually to evaluate their physical and mental capacity to perform the essential functions of a Peace Corps Volunteer. With reasonable accommodation, Volunteers must be able to perform these functions without undue risk of disruption of service or unreasonable risk to their health. OMS determines whether an applicant is medically qualified for Peace Corps service and identifies country-specific resources that will allow applicants with conditions requiring accommodation to serve safely and effectively.

The medical accommodation program within OMS facilitates the decision-making process regarding applicants with special medical or site-placement needs. The medical pre-service team and/or the medical accommodation coordinator review all applicants who have special medical needs or require special site placement. Applicants with conditions that require special medical monitoring (i.e., beyond routine care) are cleared by the pre-service team for country-wide service in countries that can support such monitoring. Applicants with conditions that require a specific geographic location or require proximity to an urgent-care medical facility are cleared for site-specific service by the medical accommodation coordinator. This process includes consultation among the OMS and Peace Corps post staff.

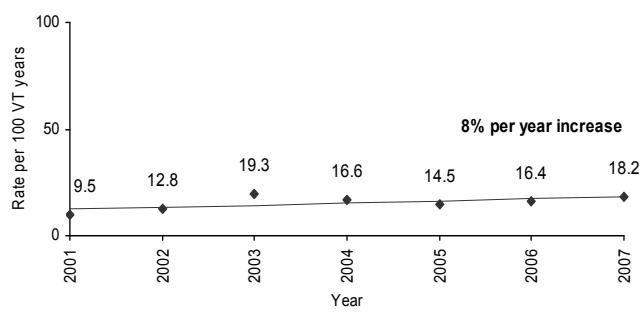

This rate has been increasing an average of 8 percent per year since 2001.

**Figure 59: Number of medical accommodations, by year and type—Peace Corps Volunteers, 2001–2007**

The most common accommodations in 2007 were psychotropic medication monitoring (8B [340 accommodations]) and access to mammography services (151 accommodations). Volunteers may be accommodated for more than one condition.

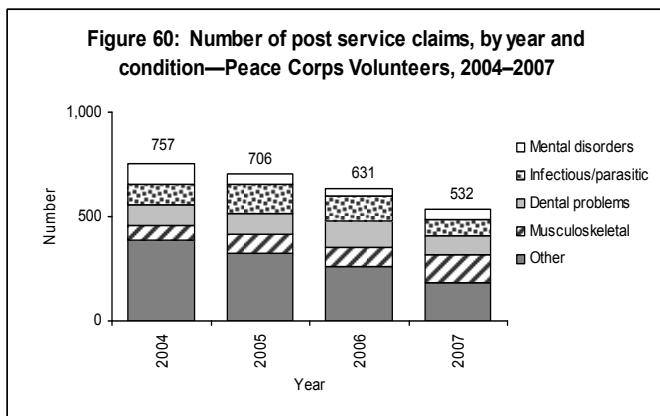

**Figure 58: Incidence of medical accommodations, by year—Peace Corps Volunteers, 2001–2007**

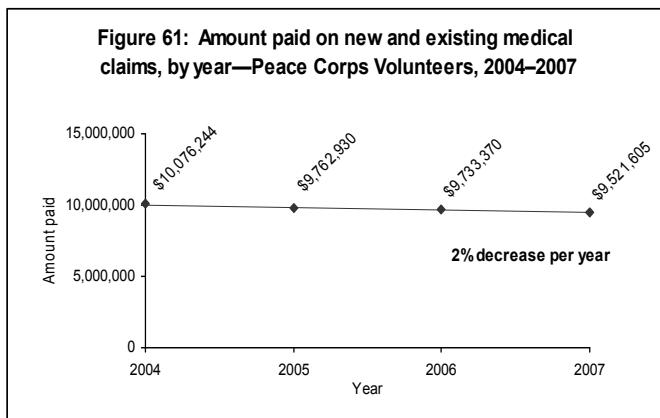

In 2007, there were 1346 accommodations resulting in a rate of 18.4 accommodations per 100 VT years.

### **Post-service claims**

After their close of service, Volunteers have three years in which to file claims under the Federal Employees' Compensation Act (FECA) for conditions that were caused, accelerated, or exacerbated by their service. Claims are filed with the Peace Corps, adjudicated by the Department of Labor, and paid by the Department of Labor with Peace Corps funds.

In 2007, post-service medical claims were filed by 532 returned Volunteers. The most common claims were for diseases of the musculoskeletal system and connective tissue (136 claims, 26 percent), dental problems (88 claims, 17 percent), and infectious and parasitic diseases (78 claims, 15 percent). Forty-seven claims were filed for mental disorders (9 percent).

In the 2007 calendar year, Peace Corps paid \$9,521,605 for Volunteer claims accepted by the Department of Labor. There has been a 2 percent per year decrease in the payments since 2004.
